Vestry

Milestone grants on Portaldot that pay when the work ships.

Each tranche waits in escrow until reviewers approve it and the grantee’s own app shows real use, then lands as a native Portaldot vesting lock.

Portaldot Hacker House 2026 · Ecosystem DApps · vestry-grants.vercel.app

Grants still pay on trust

Paid on a message

A reviewer says yes in a chat, someone sends a manual transfer, and a spreadsheet records it.

Paid before it’s used

Nothing ties a payout to people actually using what was built.

Hard to see

The funder can’t see what was approved. The grantee can’t see what is owed or when.

Portaldot’s own builder support is “unlocked based on project progress, product readiness, on-chain activity” and milestone review. Vestry makes those conditions enforceable on chain.

Quote: Portaldot Hacker House 2026 page, “Post-Hackathon Ecosystem Support”

How Vestry works

1

Fund

The funder escrows the whole grant, split into milestones.

2

Submit

The grantee posts evidence: a commit, demo or transaction.

3

Review

A quorum approves. A change request resets the round.

4

Usage gate

Optional: a count read straight from the grantee's contract.

5

Vesting lock

Paid as a native Portaldot vesting schedule.

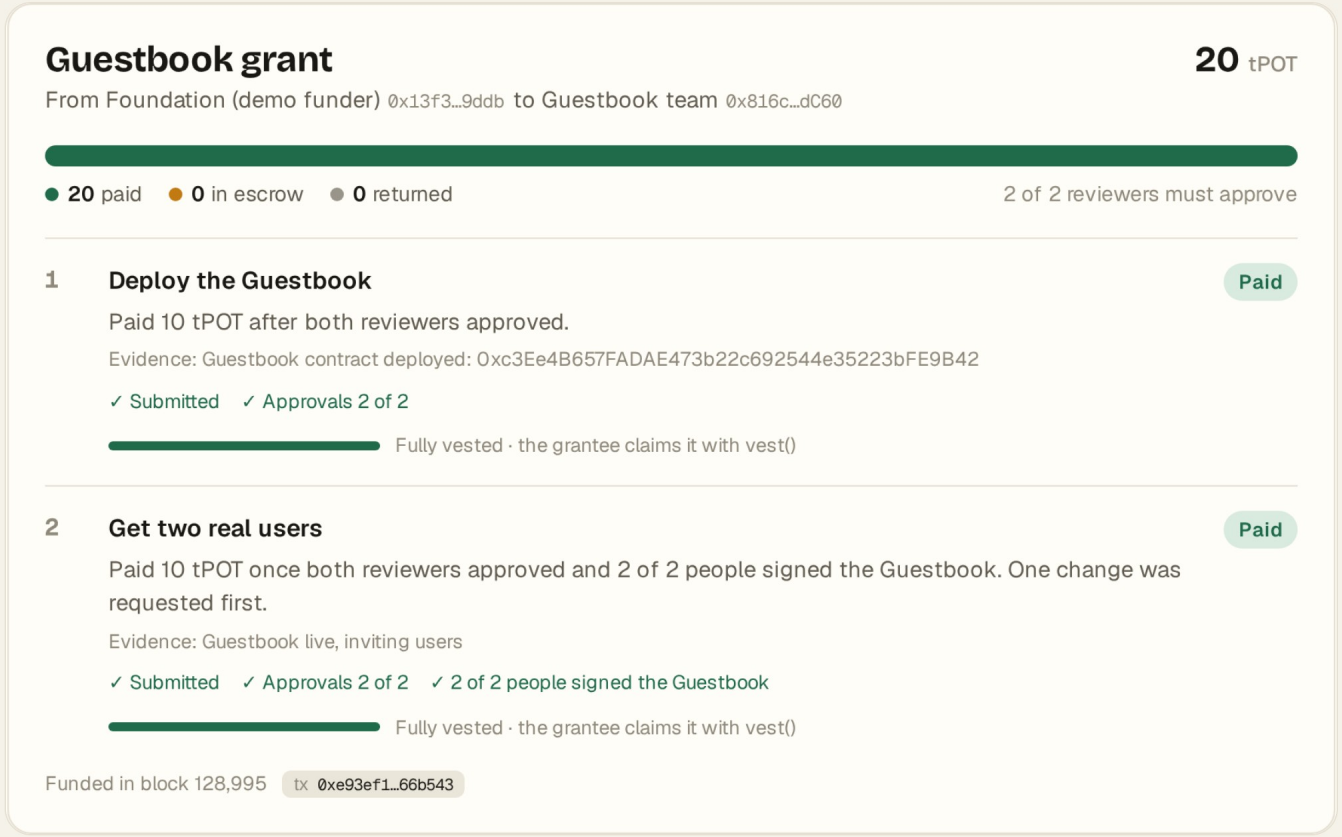

Miss the deadline and the unpaid tranche goes back to the funder. Below the usage target, approvals are kept and the money stays in escrow until the number is met.

Why it has to be Portaldot

Portaldot V3 feature	What Vestry does with it	On a plain EVM chain
Vesting precompile (pallet-vesting)	Every POT tranche becomes a native vesting lock on the grantee's account	A custom vesting contract that holds the money
Assets ERC-20 precompile	Grants in a native Assets token, no wrapper contract	A separate token contract per asset
pallet-revive (EVM on Substrate)	Solidity logic and native runtime modules in one call	No native modules to call
H160 ↔ native account mapping	The grantee claims with vest() from an EVM wallet; the lock lives on their native account	One account model only

The money never sits in a contract balance after payout. It sits in the chain's own vesting module, where wallets and the node console can see it.

It runs on PortaldotV3 testnet today

The live app reads every number straight from the Vestry contract. No backend, no sample data.

Shown: the Guestbook grant, 20 tPOT in two milestones, both paid after 2-of-2 review and now fully vested to the grantee.

`Vestry 0x12d0…cda9`
`chain ID 420420777`

Screenshot of vestry-grants.vercel.app, captured 2026-10-22. Names in the app are its own labels; the contract stores addresses and amounts.

Approved is not the same as paid

Milestone 2 asked for two real users of the grantee's Guestbook.

1. A reviewer requested changes; that round's approvals reset.
2. Both reviewers then approved.
3. Held in escrow: the Guestbook showed 0 of 2 users.
4. Two people signed. Vestry read the count and paid.

```
held 0x8acf565e…bdd0
paid 0x9a74a802…b846

Contract events from the app's Proof tab. Transactions sent by scripts/flow.js with testnet wallets; all hashes in evidence/testnet.json.

The payout is a native Portaldot lock

19.92 tPOT → 0

Two pallet-vesting schedules sat on the grantee's native account. The grantee called vest() on Portaldot's vesting precompile, and the lock was gone.

`vest() tx 0x4147764f9e1d87ba944c9c2ef7abb67359106d58401118a4d1aeb416d006f946`
`block 135,631 · status 1 · account 5EzQM2V4…ZbbE`

Read back from the Substrate side with scripts/readback.mjs before and after (evidence/vest-claim.json).

What is built and checkable

2
contracts deployed on PortaldotV3 testnet

14
lifecycle transactions across two grants

5
refusal cases proven on testnet

9
automated contract tests passing

- A live web app with Grants, Review and Proof tabs, reading the chain directly
- A public repo with every transaction hash, the scripts to reproduce them, and a 1:52 demo
- Findings shared back: the real vesting precompile address, storage deposit costs, the 10 tPOT minimum

Sources: evidence/testnet.json, evidence/deployments.json, test/Vestry.test.js in github.com/nftkingiii/vestry

Why keep building it on Portaldot

For the ecosystem

- A ready rail for Portaldot's own builder support and any team's grants
- Every payout uses native modules: vesting, assets, later identity and multisig
- Open source (MIT), with findings fed back to Portaldot builders

Next milestones

1. Full grant lifecycle driven from the web app with MetaMask
2. Native Assets grants and in-app vest() claims
3. Reviewer councils via Portaldot multisig and identity
4. Security review, then a pilot with an ecosystem funder

Fittingly, Vestry can fund its own roadmap: each milestone above can be a Vestry milestone, paid only when it ships.
